

PROJECT REPORT

Title: Cloud-Based Bus Pass System

Task Number: 03

Objective:

To develop an online bus pass booking system hosted on the cloud that prevents ticket loss, theft, and incorrect pricing while providing scalability and reliability.

Introduction:

Traditional ticket booking systems face issues such as ticket loss, pricing errors, and limited scalability. A cloud-based bus pass system provides secure storage, reliable access, and the ability to handle high traffic efficiently.

Problem Statement:

The existing ticket booking systems may suffer from:

- Ticket loss and theft.
- Incorrect ticket pricing.
- Poor performance during peak traffic.
- Limited scalability and reliability.

Proposed Solution:

The Cloud-Based Bus Pass System stores ticket information securely and generates digital bus passes. It uses cloud concepts to improve reliability and scalability while ensuring correct pricing.

Technologies Used:

- Java

- Eclipse IDE
- Object-Oriented Programming
- Cloud Computing Concepts

Modules

1. BusPass Module:

Stores passenger details such as name, age, source, destination, and ticket price.

2. Ticket Price Module:

Calculates and validates ticket prices to avoid pricing errors.

3. Cloud Storage Module:

Simulates cloud storage to prevent ticket loss and provide secure access.

4. Booking Module:

Creates and displays the bus pass after successful booking.

Working Process:

1. User enters booking details.
2. Ticket price is calculated.
3. Passenger information is stored securely.
4. Digital bus pass is generated.
5. Booking confirmation is displayed.

Advantages:

- Secure digital ticket storage.
- Reduced manual errors.

- High availability.
- Better performance during heavy traffic.
- Easy access to ticket information.

Expected Output:

Ticket stored securely in cloud.

===== BUS PASS =====

Passenger Name : Pallavi

Age : 20

From : Vijayawada

To : Hyderabad

Price : ₹150.0

Booking Successful

Conclusion:

The Cloud-Based Bus Pass System demonstrates how cloud computing concepts can improve ticket booking services by enhancing security, scalability, and reliability. It offers a seamless and efficient booking experience for users.
